 PS Claim 3; Page 28-29; 36pp; English.
 XX
 CC The present sequence is the human obese (ob) protein, a body weight
 CC modulator, which can be administered to patients suffering from ob gene
 CC defects or mutations which prevent or interfere with its production
 CC and/or function. The ob protein can be used to treat, prevent or control
 CC obesity and associated diseases by reducing food intake and weight gain
 CC in mammals. It can also be used to treat related conditions such as type
 CC II diabetes mellitus, hypertension and hyperlipidaemia, and to identify
 CC ob protein receptors. The human ob gene was isolated by screening a
 CC lambda phage cDNA library, made from human adipocyte tissue derived RNA,
 CC with a murine ob gene obtained using the methods of Zhang, Y. et al.,

PT Obesity polypeptide(s) able to modulate body wt. - useful for e.g.
 PT reducing wt. in treatment of diabetes, high blood pressure and high
 PT cholesterol and for cosmetic reasons.

XX

PS Claim 2; p171-172; 304pp; English.

XX

CC This sequence represents the human obesity polypeptide (OBP). OBP (also
 CC known as leptin) is a hormone involved in the regulation of body weight.
 CC This sequence has effects on both food intake and energy expenditure. OBP
 CC and its analogues are useful for modifying body weight (optionally
 CC combined with known medicaments), for treating diabetes, high blood

CC pressure or high cholesterol. The DNA encoding this sequence (and
 CC sequences complimentary to it) can be used in gene therapy for modifying
 CC body weight. This protein can be used for reducing weight for health or
 CC cosmetic reasons in obese humans, or to produce leaner food animals.
 CC Antagonists of OBP (including antibodies) are useful for increasing body
 CC weight, e.g. for treating weight loss associated with cancer, or for
 CC cosmetic reasons in humans, or for production of Kobe beef or Foie gras
 CC in domestic animals. OBP antibodies (Ab) can also be used in diagnostic
 CC immunoassays for the presence of OBP. The formation of Ab-OBP complexes
 CC enables in vitro evaluation of levels of OBP in a sample, especially to
 CC detect diseases associated with elevated or decreased levels, and to
 CC monitor treatment of these diseases

 PT Use of obese protein for inducing bone formation - particularly for
 PT treating osteoporosis, repairing fractures, dental defects or
 PT resectioning due to oncogenesis.
 XX
 PS Disclosure; Page 32; 42pp; English.
 XX
 CC The present sequence represents a human obese (ob) protein. DNA sequence
 CC was isolated from an adipose tissue cDNA library using a probe derived
 CC from the mouse obese gene. ob proteins can produce a dramatic increase in
 CC osteogenic cells or their bone-forming activity. They can enhance
 CC recruitment or migration of bone-forming cells to the proper bone-forming
 CC tissues and tissue sites. The ob protein was used in the method of the
 CC invention, which involves the stimulation of a cell population containing
 CC marrow mesenchymal cells. The method comprises exposing the cell
 CC population to an ob protein for expansion of osteogenic cells, a
 CC biological fluid obtained from an ob protein-treated mammal, or a culture
 CC medium that has been conditioned by growth of endocrine or CNS cells or
 CC tissue exposed to ob protein. The method can be used in a mammal for
 CC promoting bone repair or bone healing, stimulating bone ingrowth into a
 CC prosthetic device or dental implant that has been inserted into a mammal,
 CC for treating bone loss, for increasing bone length, for stimulating
 CC active bone growth, or for inducing bone formation

PT Nucleic acid primers and probes useful for detecting mutations in
PT mammalian OB gene associated with regulation of body weight and
PT adiposity.

XX

PS Example; Fig 3; 153pp; English.

XX

CC The present sequence is encoded by a nucleotide sequence used in an
CC invention relating to the control of body weight of animals including
CC humans. Nucleic acids of at least 10 nucleotides which are hybridisable
CC to a non-coding region of an OB nucleic acid have been created. The OB
CC gene plays a critical role in the regulation of body weight and
CC adiposity. The nucleic acids may be used as probes or as primers for PCR.
CC They are useful for evaluating the presence of mutations in the human OB
CC gene or for evaluating the level of expression of OB mRNA. Defects
